

News Release

Ashland Rosaliss™ biofunctional blossoms in May with new clinical study data

Sophia Antipolis, France, May 28, 2020 – Ashland is celebrating the flowering of the *Rosa Centifolia* rose, that blooms fully during the month of May in the Provence region of France, with new clinical data for Rosaliss™ biofunctional.

Ashland's Rosaliss™ biofunctional is a 100% nature-derived extract from this iconic flower that offers outstanding efficacy to help skin achieve a flawless repair and brings a new dimension to manufacturers with a novel type of natural and environmentally conscious extract. Rosaliss™ biofunctional uses Ashland's proprietary and patented Plant Small RNA technology for extractions from fresh petals. It is unique technology designed to capture the specific functionality of the rose's metabolism to resist environmental changes and heal.

A new clinical study was performed in the Ashland clinical lab in Shanghai, China on two groups of 35 volunteers. The first group had age flaws and sagging skin, and the second group had acne blemishes or post-acne marks. The volunteers tested Rosaliss™ biofunctional at 1 percent in a cream over a 28-day period. The new results indicate that Rosaliss™ biofunctional helps repair acne-damaged skin and results show that skin looks:

- evened and brighter: skin texture looks visibly smoother, appearance of fewer fine wrinkles and pores, skin reflects better luminosity;
- firmer: skin is more hydrated and firmer;
- repaired: imperfections such as acne blemishes look diminished and skin looks less sensitive.

This iconic rose flowers 100 kilometers from Ashland's offices in Provence, France, and is grown following sustainable farming techniques. It is harvested by hand while roses bloom at sunrise to capture the maximum of phytomolecules. "Rosaliss™ biofunctional has a wonderful sustainability story and it delivers great results," said Justine Cotton, global marketing manager and new business development, Ashland. "I love how we are working with this local flower that has a low carbon footprint from transporting the fresh rose petals to our factory. This legendary flower fits so well with our customer's needs and our sustainable local sourcing approach."

Rosaliss™ biofunctional has also shown great benefits associated with the protection of skin's microbiome from UV damage. As a vegetal pre-biotic, it helps preserve the healthy bacteria balance between commensal bacteria and potential pathogenic bacteria. Rosaliss™ biofunctional has also demonstrated *in tubo*, a postbiotic effect with the conversion of polyphenols by skin's microbiome into more active molecules for the skin.

Ashland has formulated a micellar rosewater that is a mild yet effective cleanser and make-up remover. It has been tested to be microbiome friendly. The micelles capture impurities, make-up and sebum from the skin without requiring scrubbing or rinsing. It contains Ashland's Conarom™ P-2 aromatic, a nature-identical aromatic. The formulation, which is suitable for all skin types, can be used on face, eyes and lips because it is gentle for the skin. Rosaliss™ biofunctional works well for sensitive and mature skin formulations and skin treatments for acne-damaged skin with blemishes and post-acne marks.

Ashland Rosaliss™ biofunctional is haute couture for the skin.

About Ashland

Ashland (NYSE: ASH) is a premier global specialty materials company serving customers in a wide range of consumer and industrial markets, including adhesives, architectural coatings, automotive, construction, energy, food and beverage, nutraceuticals, personal care and pharmaceutical.
